Lost. Dation of the Actor: pT/T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I: Site_2: Eco Ri; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NOHL)9W, testis NNT, and B-Cell libraries (fetal lung NOHL)9W, testis NNT, and B-Cell NCI_CGAP_CCBl) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PGR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726468728711, and 729065-731399. Subtraction by Bento Scares and M. Fettima Bonaldo. "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ď
       Equal amounts of plasmid DNA from three normalized libraries (fetal lung NBEL19W, testis NHT, and B-cell NCI_GGAP_GGB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of 1.M.A.G.B. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Scares and M. Fatima Bonaldo. I others

Anote—"Organ: uterus; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; ist strand CDNA was prepared from a modified polylinker; ist strand CDNA was prepared from prognant mouse uterus, and was then primed with a Not I and colloc(dT), primer. Double-stranded cDNA was ligated to Eco RI daptors (Pharmacia), dispersed with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized Library was constructed by Bento Soares and M. Fatina Bonalos.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              494 bp mRNA linear EST 15-MAY-1995

/note="Vector: Bluescript II SK -; Site_1: Eco RI; Site_2:
Xno I; The apical portion and the entire pulp of the
maxillary and mandibular incisors from 3-4 week old rats
were excised. A cDNA library was constructed in the LRAP
II vector (Stratagene) by use of poly A+RNA from these
tissues. The phage cDNA library was converted into a
Bluescript phagemid cDNA library by in vivo excision by
the Exassist/Solm system (Stratagene).

The sequence contained an oligo-df track that was present in the
The sequence contained an oligo-df track that was used to prime the synthesis of first
strand cDNA and therefore this may represent a bonafide poly A
tail. The sequence tag present in the cDNA between the NorI site
and the oligo-df track served to identify it as a clone from the
normalized olfactory buibs library cDNA Library Preparation: M.B.
Soares Lab Clone distribution: NIH BMAP CDNA clones will be made
available by the means that is soon to be determined. When NIH
determines the means for distribution of the BMAP cDNA clones, this
record will be updated accordingly when that means is determined.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a breast specific gene (BSG) clone. The BSG sequences are also referred to as breast specific markers (BSM). The invention relatest to methods for diagnosing, monitoring, staging, inaging and treating breast cancer (BC). The methods comprise measuring the levels of BSG products in cells, tissues or body fluids of the patient and comparing the measured levels of BSG, with BSG levels of a normal human control. An antibody against the BSG sequences can be labelied and used for imaging BC in a patient. The antibody can be conjugated to a cytotoxic agent, and used for treating BC in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 TGGGFGTCACGCTCGGCCTGCCCTGCTCCTTCACCCTGGAGGAGGAGGATTCA 120

                                                                                                                                                                                                                               Secreted and transmembrane proteins and nucleic acids designated PRO, useful as hybridization probes, in chromosome and gene mapping and gene
                                                                           Fong S;
Hillan KJ;
                                                                                                                                                                                                                                                                                                                                                                The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or Knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 TGGGTGTCACGCTCGCCTGCCCTGCCTCCTTCCTTCCTCCTGGAGGAGGAGGAGGATTCA 120

                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                                                                                                                                              The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, caletocal from systemic lupus erythematosus, rheumatoid arthritis, systemic selected from systemic lupus erythematory myopathies, Sjogran's systemic vascullitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thromboytopeenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems, hepatobiliary diseases of the central bowel disease, glutten-sensitive enteropathy and Whipple's disease, autoimmune or immune-mediated skin diseases, allergic disease, autoimmune or immune-mediated skin diseases, allergic disease, autoimmung graft respection and graft-versus-host-disease. AACSB378 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences AACSB372 and AABB3414 to AABB3417 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                           Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GGAGGGACCACTACATCTTTACTGCAAAGACCAGGACCATGGGGGCCTGCTCCACATGG 420 *

New mammalian DNA sequences encoding transmembrane, receptor or secreted PNO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO Polypetides given in AAY99480 to AAX99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 TGGGTGTCACGCTCGGCCTGGCCGCTGTCCTTCACCCTGGAGGAGGAGGAGGATATCA 120

The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, anging, myocardial infarctions, thromophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a coding sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Baker KP, Ferrara N, Gerber H, Gerritsen ME, Goddard A;

ABB88072 to ABL88258 encode the PRO proteins given in ABB84817 to CC ABB85003. The PRO proteins and polymucleotides have cardiant, cytostatic, antiangiogenic, hypotensive, vulnerary and antianteriosclerotic.

CC activities, and can be used in gene therapy. The PRO polymucleotides, proteins, agonists and antaquists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, co-c. e.g. cardioratcopy, trauma, cancer, ge-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, corpumphagitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma and mound healing. The PRO polymucleotides have applications of in molecular biology, including use as Abbridistation probes, and in chromesome and gene mapping ABL88259 to ABL88254 represent primers and probes used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 regerercecceccecceccecceccecrerers 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     One hundred and eighty seven nucleic acids encoding PRO polypeptides, useful in diagnosis and treatment of cardicovascular (e.g. myocardial infarction), endothelial or angiogenic disorders in a mammal

The present sequence encodes a human odorant binding polypeptide (OBP), designated OBPID-alpha. OBPS provide long-term retention (gradual release) of lipophilic compounds, so prolong the 'hold' of perfumes, deodorants etc.. OBP polypeptides are used as binding proteins for Aptrophobic ligands (particularly odorants); as competitive inhibitors (squainsts or antagonists) of cellular lipocalcin receptors; to detect specific antibodies for diagnosis of allergy, asthma or cancer; for controlling volatilisation of an odorant, specifically in perfumes, cosmetics or disinfectant compositions; to screen compounds, especially concants or flavours, e.g. human pheromones, for binding to OBP, also in analysis of complex perfume mixtures; to solubilise lipophilic compounds; for treating hyperlipidemia or obesity, or to supplement non-maternal cull when combined with nutritional farty acids, as food additives; as a transporter of pharmaceuticals, especially anticancer agents (providing delayed release) but also for delivery across the placental barrier (e.g. for detoxification of the foetus); as a marker of pregnancy or foeto-placental pathology (rupture of the amniotic membrane); and as antiallergic agents.
New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow release of perfumes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GGTGTCACGCTCGGCCTGGCCGCTGCCCTGTCCTTCACCCTGGAGGAGGAGGATATCACA 122
